Thanks Aaliyah for sharing the document with me.
I read chapter 3 and I have some comments:

- This part describes your work, so it should start at Phase 2. Phase 1 is the literature review that was already presented in Chapter 1 or 2 already, so delete this part from the chapter.
- You need to describe the LLMs used in terms of their characteristics (size, version, who produced them, performance etc...)
- You need to describe the programs submitted to the LLM more thoroughly: in terms of program length, type of errors inserted and give an example of each
- You need to state clearly the difference(s) between what you called "basic " and "advanced" programs and justify this classification. Also where you got these programs need to be mentioned and cited if gotten from a repository.
- When you run these models, describe which machine it was run on and how long it took to get an answer (if you can include a timer).
- You need to explain what Zero-Shot learning is.

- You need to explain what was detected and what wasn't, a simple cross is not sufficient and you need to do a deeper analysis of the type of errors detected and those not. (This could go to chapter 4 as well)
- you mentioned that you use Claude to evaluate the correctness of the gpt models. What did Claude detect and how its performance was (this too can go to chapter 4 in more details.)
- Last, there are so many free models in HuggingFace, you could have selected a model from another company rather than two GPT models.
